The most basic tutorial is called The Fundamentals of Gimp. It teaches you the basics of image preparation and editing techniques. Once you have completed this tutorial you should have a basic understanding of how to edit images. You can now move on to the advanced features of Photoshop. In many of the tutorials for Photoshop, Adobe recommends the Elements user interface or the Photoshop plug-ins, but can lead beginners into asking questions about features they don't have the tools to use yet. To get the most out of this guide, it's important to understand how the program is designed and what's necessary to use Photoshop effectively. This tutorial goes over how to import, organize, manipulate, and finalize an image in Photoshop to meet a client's wishes. Topics include Processing images for presentation, layout, and print Creating and editing photographs Working with color and using black and white Creating line work, such as logos Using light tools, such as the cloning tool Combining tools, such as the Healing Brush and airbrush Making corrections to images Creating masks and using texture brushes Correcting images with adjustment layers Applying filters, effects, textures, and gradients Using the direct selection tool Best practices The most important thing in any image editing or design is to test the work you are creating as often as possible. Practice with an image that you won't be showing to clients or anyone else. In Photoshop, you can create test images in the Backgrounds folder. If you are experimenting with a client, you can save your work to your computer and then share your work online. It's better to send a short, direct message to your client to let them know that you are working on their project and to ask for their approval. This way, you can gather feedback and collect more information that you can use to make changes. If you don't have a client, you can always practice for yourself in the Practice window or in the Backgrounds folder. When working with a client, it's important that you understand who is paying for the editing and why they want the edits to be made. The client's wishes may be more important than your own ideas. When you are working with a client, it's important to clearly define what the client's expectations are. This will save you time and energy. Sometimes you

The goal is to make sure value!= null. I've tried the following but I get an error: WHERE NOT (NULL = value) This works fine. However, I can't figure out how to do it with a non-null assertion operator like =. I've tried this but I get an error: WHERE NOT (value = null) Which is valid. What am I missing? A: Postgres is actually correct to complain about that, since NULL isn't a value either. You'd need to OR in a bunch of other values to NOT-include NULL: WHERE value IS NOT NULL Another option, from the documentation: SELECT * FROM tbl WHERE value 'NULL' Since you say you really wanted ISDISTINCT FROM, here's one more option: WHERE value!= 'NULL' A: Use ISDISTINCT FROM: SELECT * FROM tbl WHERE NOT (value = 'NULL') A: Not (value = null) This will always be true because 'NULL' is equal to itself. As another answer says, you can
